

Excel – Class 6 Notes

Functions, operators, references, and practical examples learned in Class 6.

1. ROUND Function

Purpose: Rounds a number to a specified number of digits.

Syntax: =ROUND(number, num_digits)

Example: =ROUND(12.567, 2) → 12.57

Key point: Normal rounding follows the usual rounding rule.

2. ROUNDUP Function

Purpose: Always rounds a number away from zero to the specified number of digits.

Syntax: =ROUNDUP(number, num_digits)

Example: =ROUNDUP(12.561, 2) → 12.57

Difference: ROUND may round up or down depending on the next digit; ROUNDUP always rounds away from zero.

4. REPT Function – Repeating Text

Purpose: Repeats text a specified number of times.

Syntax: =REPT(text, number_times)

Practical example: =REPT(" ",5) → *****

This can be used to create simple visual bars, stars, or repeated symbols.

5. ROMAN Function

Purpose: Converts an Arabic number into Roman numerals.

Example: =ROMAN(10) → X

Example: =ROMAN(25) → XXV

6. Arabic Numbers

Arabic numerals are the normal numbers used in Excel, such as 1, 2, 3, 10, 25 and 100. The ROMAN function converts these numbers into Roman numerals.

7. POWER Function

Method 1 – POWER function: =POWER(2,3) → 8

Method 2 – ^ operator: =2^3 → 8

Both methods calculate powers. The ^ symbol is Excel's exponentiation operator.

8. CONCAT Function

Purpose: Combines text from multiple cells.

Example: =CONCAT(C1," ",C4)

The " " adds a space between the two cell values.

9. & Operator – Another Method of Concatenation

Purpose: The & operator can also join text or cell values.

Example: =C1&" "&C4;

This gives the same type of result as =CONCAT(C1," ",C4).

Example: If C1 = Piyush and C4 = Dhaundiyaal, the result is **Piyush Dhaundiyaal**.

10. Locking a Constant / Cell Reference

Purpose: When copying a formula, use the \$ sign to keep a cell reference fixed (absolute reference).

Example: =\$C\$1*D2

When the formula is copied down, **\$C\$1** remains fixed while D2 changes to D3, D4, etc.

Shortcut: Select the cell reference in the formula and press **F4** to toggle reference types.

3. ROUND vs ROUNDUP – Quick Comparison

Function	Example	Result
ROUND	=ROUND(12.564,2)	12.56
ROUND	=ROUND(12.567,2)	12.57
ROUNDUP	=ROUNDUP(12.561,2)	12.57
ROUNDUP	=ROUNDUP(12.501,2)	12.51

11. Class 6 Practical Summary

- ROUND – normal rounding to specified digits.
- ROUNDUP – rounds away from zero.
- REPT – repeats text or symbols, such as stars.
- ROMAN – converts numbers into Roman numerals.
- Arabic numbers – regular numerical values.
- POWER and ^ – two methods for calculating powers.
- CONCAT – combines text from cells.
- & operator – another way to combine cell values and text.
- \$ absolute reference – locks a cell/constant when copying formulas.
- F4 – shortcut for changing reference types.
